Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

Disclosure; Page 33; 86pp; Spanish.

The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial anino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of simulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis

The present invention describes a DNA vaccine which comprises a plasmid containing 2-6 kb of the total antigen gene of hepatitis C virus (HCV). Also described: (I) a recombinant adenovirus vaccine including an adenovirus containing 2-6 kb of total antigen gene of HCV; (2) a vaccine administrating method: and (3) a method for treating or preventing HCV infection. The DNA vaccine has virucide activity. The DNA vaccine is useful in treating or preventing HCV infection. The present sequence represents a peptide from the HCV peptide pool used for the investigation of cellular immune response in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New DNA vaccine comprising plasmid containing 2-6 kb of the total antigen gene of hepatitis C virus'(HCV), useful in treating or preventing HCV
                                                                                                                                                                   DNA vaccine, vaccine, antigen gene, antigen, hepatitis C virus, HCV, recombinant adenovirus vaccine, adenovirus, HCV infection, hepatitis C virus infection; infection, virucide.
                                                                                                                                   Hepatitis C virus cellular immune response related peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptide derived from human G-protein coupled receptor HG67.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-1) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides ANY92945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis
                                                                                                                                                                                                                                                                                                                                                                                                                     Hepatotropic, antagonist, transforming growth factor betal, IGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor; liver; extracellular matrix degradation inhibitor; mimetope; cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.
                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The sequences given in AAR82556-57 are myelin basic protein (MBP) derived peptides which were used in the method of the invention for the treatment of multiple sclerosis. These peptides act as bystander antigens and act in combination with an amount of a non-interferon polypeptide having Th2-enhancing cytokine activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A set of peptide ligands for agricultural research and development of therapeutic agents comprise specific complementary peptides to proteins encoded by genes of plant genomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Plant; peptide pesticide; peptide herbicide; agricultural research.
  20 //note= "Indicated in the specification as Cys-NH2"
                                                                                                                                                                                                                                                                                                                                                   Use of oral tolerisation and/or Th2-enhancing cytokine(s)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAB68429-33 represent peptides derived from a human G-protein coupled hormone receptor, designated HGG7 or MCH-R2. HGG7 is a melanin concentrating hormone receptor. Modulators of HGG7 can be used to treat a patient, particularly to reduce weight, particularly in obesity, or to treat stress. These modulators can also be used to treat cancer, reduce pain, treat sexual dysfunction or to produce weight gain. Bringing about weight loss can be used to reduce the likelihood of hypertension, diabetes, dyslipidemia, cardiovascular disease, gall stones, osteoarthritis or certain forms of cancers. Increasing weight can be useful in the treatment of anorexia, AIDS, wasting, cachexia and frail elderly patients, or those undergoing chemotherapy or radiation therapy

The protein has a molecular weight of 37.4 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. I kappa B kinase inhibitor 37.40 can be used in the treatment of a variety of diseases such as cancer, angiccardiopathy, neurological disorders, immune disorders and inflammatory conditions. The present sequence represents the 15 N-terminal amino acids of human I kappa B kinase inhibitor 37.40 used in ELISA (enzyme linked immunosorbent assay) in an exemplification of the invention
              The present invention relates to a set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of plant sequence is one such peptide from Arabidopsis thalians. The peptides of the present invention are useful in an assay to identify a peptide, especially a peptide pesticide or herbicide. The peptides are also useful for tools for agricultural research and

The polypeptide is useful for screening drugs to identify agents capable of binding to the same binding site as the avian pancreatic polypeptide. It is also useful for diagnostic purposes to identify the presence and/or detect the levels of DNA or protein that binds to the polypeptide, in treatment of diseases associated with the presence of a particular DNA or protein, where the polypeptide can be used to bind to DNA to promote or inhibit transcription and for identifying binding partners. The present sequence is that of a miniature protein of the invention used to modulate the interaction between a known protein and another molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polypeptide scaffold e.g. an avian pancreatic polypeptide that comprises modification by substitution of an amino acid residue, that is exposed on the alpha helix domain of the polypeptide is useful for screening for

                                                                                                                                                                                                RESULT 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAE09350
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               요
                                                                           ð
                                                                                                                    원
                                                                                                                                                                                                                                                The present invention describes antigenic peptides (I) comprising: (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino acids. Also described: (1) an assay for the detection of a particular G protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; and (2) an isolated antibody having high specificity and high affinity or a particular GPCR. (I) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting an antibody against a particular GPCR. and in the production of specific antibody against a particular GPCR. and in the production of specific antibodies. The peptides and antibodies are also useful for detecting the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for diagnosing and designing drugs for careaing immune-related diseases, immunological-related diseases, coll research diseases, or autoimmune diseases, growth-related diseases, coll sease, atherosclerosis, bacterial, fungal, protozoan or viral infections, osteoarthritis, osteoporosais, cancer, cardiomyopathy, chronic and acute disease, parkinson's disease, multiple sclerosis, graft versus host disease, pallepsy, asthma, tuberculosis, pentil, mental retardation, memory loss, epilepsy, asthma, tuberculosis, obesity, nausea, hypertension, hypotension, renal disorders, rheumatoid arthritis, trauma, ulcers, or any other disorder in which GPCRs are involved. The antibodies may be used in immunoassays and immunodiagnosis. A pure 3-phosphoinositide-dependent protein kinase (3PDPK) that phosphorylates and activates PK B-alpha has been isolated. The present sequence represents a rabbit 3-phosphoinostide dependent protein kinase peptide. Products from the present invention (e.g. 3PDPK, nucleotide sequence encoding 3PDPK, antibodies against 3PDPK) can be used to diabnify compounds which modulate the PK activity e.g. for treating diabetes or cancers or for enhancing cell proliferation in the regeneration of nerves or in wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is human ion channel-10 (ion-10) protein. The invention relates to human ion channel polypeptides and nucleic acid molecules encoding such polypeptides. The ion channel proteins are useful targets for discovering ligands or drugs to treat discorders or defects, including schizophrenia, depression, anxiety, attention deficit hyperactivity discorder (ADHD), migraine, stroke, ischaemia, respiratory diseases (e.g. asthma), brain injury, neurodegenerative diseases such as Alzheimer's disease, Parkinson's disease, glaucoma and macular degeneration. Compounds which modulate ion channel proteins are used in the treatment of cardiovascular diseases including congestive heart failure, arrhythmia, high blood pressure, restenosis, endocrine disorders (e.g. cardiovascular) publipolar and other mood disorders, inflammatory conditions, autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             channel proteins are used as research tools for identification, characterisation and purification of interacting regulatory proteins. Ion channel cDNAs are used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                             New ion channel polypeptides and polynuclectides encoding them, for treating e.g. schizophrenia, depression, anxiety, attention deficit hyperactivity disorder, migraine, stroke, ischemia, respiratory diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                disorders, muscular disorders, obesity and retinal degeneration. The ion channel proteins are used as research tools for identification,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The ion channel sequences and their modulators are used for the treatment of viral infections (e.g. human immunodeficiency virus (HIV)), thyroid discrders (e.g., thyrotoxicosis, myxodema), renal failure, inflammatory conditions (e.g., tryrotoxicosis, myxodema), renal failure, inflammatory conditions (e.g., Crobn's spychotic and neurological disorders (e.g. anxiety, depression and schizophrenia), dyskinesias (e.g. Huntington's disease), degenerative disorders (e.g., Parkinson's disease, Alzheimer's disease), cardio-vascular diseases, cancer, metabolic disorders (e.g. anorexia, obesity) and mental disorders. The present sequence is ion channel-72 (ion72)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        infections, inflammatory conditions (e.g. Crohn's disease), diseases related to homeostasis, rheumatoid arthritis, autoimmune disorders, central nervous system (CNS) disorders (e.g. dementia, Hutingron's disease), degenerative disorders (e.g. Parkinson's and Alzheimer's disease), cardiovascular diseases (e.g. myocardial infarction), cancer, and hormonal disorders. The polymucleotide sequences are useful to design novel transcription factors for modulating the expression of human ion polypeptides in native cells, and cells transformed or transfected with them. The present sequence represents an amino acid sequence encoded by a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the isolation of novel human ion channel polypeptides, and the polynucleotide sequences encoding them. The human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ion channel polypeptides are useful for inducing an immune response in a mammal, and for identifying a compound which binds to and/or modulates the ion channel. The polynucleotide sequences encoding human ion channel polypeptides are useful for screening restriction fragment length polymorphisms (RRLPs) associated with certain disorders, and for genetic mapping. The human ion channel polypeptide and polynucleotide sequences are useful in the treatment of diseases or conditions such as viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel human ion channel polypeptide, useful for inducing an immune response in a mammal and for treating disease or conditions related to

The invention relates to a composite binding polypeptide comprising a first natural binding domain derived from a first natural binding copy peptide and a second natural binding domain derived from a second natural binding polypeptide, where the first and second natural binding control from the first and second natural binding polypeptide, where the first and second binding polypeptides. The invention also relates to a chimeric second binding polypeptides. The invention also relates to a chimeric polypeptide comprising a binding polypeptide cited above and a biological effector domain, a library of natural binding domains. A library of natural zinc finger nucleic acid binding polypeptide capable of chatched to it, a method for selecting a binding polypeptide capable of binding to a target site and a method for designing a composite binding polypeptide. The methods and compositions of the present invention are useful for designing sequence-specific binding proteins for regulation of compositions of disorders, and as research corn and in transgenic animals. This sequence represents a human zinc finger DNA binding domain used in the scope of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nootropic; neuroprotective; neuroleptic; immunosuppressive; cardiant;

The invention describes an isolated nucleic acid comprising a sequence encoding at least a portion of an ion channel (ion-x). The invention is useful to detect and treat diseases and conditions of the brain, particularly mental disorders, including schizophrenia, depression, anxiety, attention deficit hyperactivity disorder, migraine, stroke, and newidegenerative diseases such as Alzheimer's disease, Parkinson's disease, glaucoma and macular degeneration, cardiovascular diseases such as ischaemia, congestive heart failure, arrythmia, high blood pressure and restenosis. The invention may also be used to detect or treat thyroid disorders, renal failure, inflammatory conditions, autoimmune disorders including rheumatoid atthitis, movement disorders, central nervous system disorders, inflections, eating disorders, cardiovascular disorders is including thrombosis and athersclerosis, and proliferative disorders such as cancers, hormonal disorders and escual dysfunction. This is the amino cid sequence of a novel ion channel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid sequences encoding ion channels are useful to detect and treat human diseases and conditions, particularly of the brain,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 26, Application US/10197954

Publication No. US20030119021A1

GENERAL INFORMATION:

APPLICANT: R'ster, Hubert

APPLICANT: R'ster, Hubert

APPLICANT: Siddiqi, Suhaib

APPLICANT: Little, Daniel

TITLE OF INVENTION: Capture Compounds, Collections Thereof

TITLE OF INVENTION: And Methods For Analyzing The Proteome And Complex;

TITLE OF INVENTION: Compositions

FILE REFERENCE: 24743-2305

FILE REPERENCE: 24743-2305

CURRENT APPLICATION NUMBER: 60/306,019

PRIOR PLING DATE: 2001-08-21

PRIOR PLING DATE: 2001-08-31

NUMBER OF SEQ ID NOS: 149

SOFTWARE: FastSEQ for Windows Version 4.0

The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of simulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis

Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides ANY92945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis
                                                                                                                                                                                                                                                                                                                                                   Hepatotropic, antagonist, transforming growth factor betal, TGF-b1, competitive inhibition, collagen synthesis stimulation inhibitor, liver, extracellular matrix degradation inhibitor; mimetope, cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

                                                  The present sequence is a peptide which binds to thrombopoietin (TPO) receptor (TR). The compound can be used for treating patients suffering from haematological disorders and thrombocytopenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. The peptide may also be used to maintain the proliferation and growth of TPO-dependent cell lines and for use in biological research, for detecting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                The present peptide, which binds the thrombopoietin receptor (TR), consect to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia resulting from chemotherapy, radiation therapy or marrow transfusions. It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and thrombopoietin dependent cell lines
                                                                                                                                                                                        Peptides and peptide mimetics which bind to and activate the thrombopoietin receptor – useful in treatment of haematological disorders, esp. thrombocytopenia resulting from chemotherapy, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes composition of matter (1) comprising an FC domain, pharmacologically active peptides, and linkers. Where (1) is:

(X1) = T-(X2)b, where: F1 = an FC domain; X1 and X2 = are each independently selected from -(11) C-P1 -(12) d-P2, -(11) c-P1 - (12) d-P2 - (13) e-P3, or -(11) c-P1 - (12) d-P2 - (13) e-P3, and P4 = are each independently sequences of pharmacologically active peptides; Li, Li, Li, and Li = are each independently linkers; and a, b, c, d, e, and f = are each independently 0 or 1, provided that at least 1 c, d, e, and f = 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an FC domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as FC receptor binding, protein A binding, complement fixation, and cossibly placental transfer. Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that
bind to and activate the human thrombopoletin receptor (TPD-R). Methods
of activating thrombopoletin receptors in cells comprise contacting the
cells with effective amounts of peptides and peptide mimetics attached to
cells with effective amounts of peptides and peptide mimetics attached to
chydrophilic polymers. The methods are used to treat thrombocytopenia such
ce st that due to chemotherapy, radiation therapy or bone-marrow
cransplantation and to prevent thrombocytopenia in patients at isk. The
sequences are used to treat and prevent haematological disorders
ce including thrombocytopenia and platelat disorders in vitro
as unique tools for understanding the biological role of thrombopoietin
ceptor. The peptides can be used to detect TPO receptors on living
cells and fixed cells, in biological fluids, in tissue homogenates, and
cells and fixed cells, in biological livids, in tissue homogenates, and
cells and fixed cells, in biological sorting, western blocting and
centyme-linked immunosorbent assay (ELISA). In addition, the peptides can
be used for in vitro expansion of megakarycytes and their committed
centyme-linked imunosorbent assay (ELISA). In addition, the peptides can
ce progenitors alone or in conjunction with additional cytokines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modified peptide; mimetic; Fc domain; fusion; immunoglobulin G; IgG; EFO; erythropoietin; TPO; tumour necrosis factor alpha inhibitor; TPO; mimetic peptide; EPO mimetic peptide; EMP; VEGF antagonist; TMP; MMP inhibitor; antiinfeunde; EMP; VEGF antagonist; MMP inhibitor; antiinfeunde; antiatrheuneric; antiinfeunderic; antiatrheuneric; antiatrheuneric; antiatrheuneric; antiatrheuneric; antiatrheuneric; antiatrheuneric; antiatrheuneric; antimifertility; haemostatic; dermatological; neuroprotective; inflammatory disease; autoimmune disease; tumour growth; ancer; rheumatoid arthritis; diabetic retinopathy; infertility; obesity; sleep disorder; neurological degenerative disease; anaemia; thrombocytopaenia; metastatic tumour; systemic lupus erythematosus;

The present invention describes a ventile peptite moutry. Immunosuppressive, the present invention describes a ventile formulation of the person of the prophylactic agent as well as for screening purposes. (I) is useful for prophylactic agent as well as for screening purposes. (I) is useful for diagnosing diseases characterised by dysfunction of their associated protein of interest, for identifying normal or abnormal proteins of interest, as a part of diagnostic kit to detect the presence of their proteins of interest in a biological sample. Additionally, (I) is useful for treating inflammanerory and autoimmune diseases, unmour growth, cancer, returning inflammanerory and autoimmune diseases, unmour growth, cancer, infertility, and neurological degenerative diseases. (I), comprising conformation of arthritis, diabetic retinopathy, obesity, sleep disorders, infertility, and neurological degenerative diseases characterised by low mimetic compounds are useful for treating disorders characterised by compounds are useful for treating conditions that involve an existing megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet cand remour which result in thrombocytopeania, systemic lupus erythematosus, and Fanconi's syndrome. Furthermore, the CDR mimetibody is useful for plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms of immune, cardiovascular, infectious, malignant and or neurologic diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, adranticrobial, cytostatic and neuroprotective activities. This peptide sequence is a TPO mimetic peptide sequence used to make a mimetibody of the invention.
                                                                                                                                                                                                           This invention relates to novel mammalian CDR mimetibodies, specific portions or variants thereof. Specifically, it refers to an antibody fragment where a protein has been inserted into, or replaces a portion of, one or more CDR regions, such that each CDR mimetibody comprises at least one portion of a heavy chain or light chain variable region, which itself comprises at least one human framework region and at least one ligand binding region (LBR). The present invention describes human mimetibodies, including modified immunoglobuling and cleavage products
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New CH1-deleted mimetibody polypeptides and nucleic acids, useful for modulating, treating, alleviating, preventing an immune, cardiovascular, or neurodegenerative disease or disorder, anemia, cancer, or infectious
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
variable region comprising human framework or ligand binding region, useful for preparing a composition for treating e.g., immune, cardiovascular or neurologic disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CH1 deleted mimetibody; immunosuppressive; cardiovascular; cardiant;

                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                          which encode them), compositions, methods and uses. The invention may useful for the development of compounds with an immunosuppressive, cardiavascular, cardiant, hypotensive, neuroprotective, nootropic, antibacterial, virucida or fungicide activity. In addition, the disclosed sequences may prove useful for gene therapy. The CH1-deleted mimetibody is useful for disgnosing or treating a disease condition in a cell, tissue, organ or animal, specifically for modulating, treating, preventing the incidence or reducing the symptoms of an immune, cardiovascular (for example multiple sclerosis, dementia failure), or neurodegenerative (for example multiple sclerosis, dementia or Alzheimer's disease or disorders, anaemia, cancerous conditions, or infectious diseases for example bacterial, viral or fungal infection). The present sequence is that of a peptide which may be used during the creation of a mimetibody of the invention.
                                                              This invention relates to CH1 deleted mimetibodies (and the DNA sequences

Interior relates to the detected and uses. The invention may be useful for the development of compounds with an osteopathic, cardiovascular-Gen, dermatological-Gen, auditory, endocrine-Gen, garactological-Gen, auditory, endocrine-Gen, gastrointestinal-Gen, gynaecological-Gen, hepatotropic, haemostatic, immunomodulator, antiallergic, muscular-Gen, cytostatic, newscatatic, antiallergic, muscular-Gen, cytostatic, continglammatory, neuroleptic, ophthalmological, nephrotropic or respiratory-Gen activity acting as a tumour necrosis factor (TNF) - modulator or cytokine-agonist. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of the CHI deleted mimetibody, such as a bone or joint, cardiovascular, dental or oral, dermatological, ear, nose or throat, endocrine, metabolic, gastrointestinal, gynaecological, hepatic, obsterial, hematological, neurological, interional, ophthalmologic, musculoskeletal, oncological, neurological, untritional, ophthalmologic, sequence is that of a peppide which may be used during the creation of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                   This invention relates to CH1 deleted mimetibodies (and the DNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel human thyroglobulin 38 and polynucleotide for coding this polypeptide, useful for treating diseases such as simple goiter, thyroiditis, hyperthyroidism, hypothyroidism, thyroid tumor and nodular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; thyroglobulin 38; cytostatic; antiinflammatory; simple goitre;
thyroiditis; hyperthyroidism; hypothyroidism; thyroid tumour;
nodular goitre.

This invention relates to a novel polypeptide encoded by an alternative reading frame of a pathogenic virus, where the polypeptide starts with a methionine amino acid residue, which comprises an antigenic determinant and more than 7 amino acid residues. The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a hepatitis C virus CTL epitope peptide of the
 New polypeptide encoded by an alternative reading frame of a pathogenic virus comprising an antigenic determinant, useful for treating or preventing an infection with the pathogenic virus.

 This invention relates to a novel polypeptide encoded by an alternative reading frame of a pathogenic virus, where the polypeptide starts with a methonine amino acid residue, which comprises an artigachic determinant and more than 7 amino acid residues. The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a hepatitis C virus CTL epitope peptide of the
 The present invention describes human thyroglobulin 38 protein (I). (I) has cytostatic and antilinflammatory activities. (I) and the polynucleotide (II) encoding it can be used in the treatment of diseases such as simple goitre, thyroiditis, hyperthyroidism, hypothyroidism, thyroid tumour and nodular goitre. The present sequence represents the N-terminal peptide of human thyroglobulin 38, which is used in an example from the present invention
 New polypeptide encoded by an alternative reading frame of a pathogenic virus comprising an antigenic determinant, useful for treating or preventing an infection with the pathogenic virus.

The present invention describes a type II restriction endonuclease, designated Papol, from Pyrococcus species G-I-H. The endonuclease recognises and cleaves the following base sequence before the first C at the 5' end, to give a five base overhang at the 5' end, 5'-CC(A/I)GG-3'. Also described are: (1) isolated DNA (I) obtainable from Pyrococcus species G-I-H and coding for the Papol restriction endonuclease; (2) isolated DNA (II) obtainable from ATCC (No. 98435 and coding for the Papol restriction endonuclease (1) is inserted; (4) a cloning vector comprising (II); and (5) a host cell transformed with the vector as in (3) or (4). The endonuclease can be isolated using conventional protein purification techniques from Pyrococcus sp. G-I-H. Alternatively, the endonuclease, along with its corresponding methylase can be obtained using recombinant DNA techniques. Restriction endonuclease PspGI is useful in genetic engineering. The DNA, vectors and host cells are all useful for recombinantly producing the endonuclease in commercial quantities. The present sequence represents
 New Type II restriction endonuclease from Pyrococcus species G-I-H - and DNA coding for the endonuclease, optionally with its methylase for recombinant production of the restriction enzyme.
 PapGI; type II restriction endonuclease; Pyrococcus; methylase; recombinant.
 motif IV from the PspGI methylase
 PspGI methylase motif IV peptide.

Borrelia burgdorferi plasmid cp32-7, possible partition proteins, complete cds (Borrelia burgdorferi plasmid cp32-6, possible partition proteins, complete cds) (Fragment).

Borrelia burgdorferi (Lyme disease spirochete).
 FUNCTION: MAY HAVE AMINOPEPTIDASE ACTIVITY.
BUXYME REGULATION: STIMULATED BY DIT. STRONGLY INHIBITED BY ZINC
EIGH, FERROUS ION, CUPRIC ION, MERCURY ION, N-BROWOSUCCINIMIDE AND
N-ETHYLMALEIMIDE. PARTIALLY INHIBITED BY COBALT ION.

Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

Claim 9; Page 82; 86pp; Spanish.

The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of simulation of collagen synchesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis

```
signal peptide that is the same as the native signal peptide except that the 3 C-terminal amino acid residues are Ser-Trp-Ser The invention is directed to glycosylated leptin proteins (see AAA95799-804) that have a Stokes' radius greater than that of naturally occurring human leptin. A claimed method for manufacturing a glycosylated leptin involves culturing a host cell containing a DNA sequence encoding a signal peptide and a glycosylated leptin protein. Preferred signal peptides have a peptidase cleavage site optimized for glycosylation efficiency. When leptin+459+102 (see AAY95802) was expressed as a fusion with the present signal peptide, the degree of glycosylation (on a scale of 1-5) was 3.5 in COS host cells and 4 in CHO host cells. Glycosylated leptins, or nucleic acids encoding them, are used in the treatment of obesity, diabetes and the effects of high blood lipid content (claimed). They have longer systemic circulation times in vivo than native leptins
 Glycosylated leptin proteins having a Stokes' radius greater than that of

 The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein X and may increase its biological in vitro/in vivo such as cancer, reproductive disorders, digestive disorders (e.g. Crohn's such as cancer, reproductive disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. diabetes), hemancopoietic disorders, neural disorders (e.g. Alzheimer's, Parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis).

The present invention describes composition of matter (I) comprising an CF domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a-F1-(X2)b, where: F1 = a re down in the composition in the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition can have cytoedatic, and f1 = are each independently sequences of pharmacologically active CC plant and F1 = are each independently or 1, provided that at least 1, cc, d, e, and f1 = are each independently or 1, provided that at least 1, cc, d, e, and f2 = are each independently or 1, provided that at least 1, cc, d, e, and f2 = are each independently or 1, provided that at least 1, cc, d, e, and f2 = are each independently or 1, provided that at least 1, cc, d, e, and f2 = are each independently or 1, provided that at least 1, cc, d, e, and f2 = are each independently or 1, provided that at least 1, cc, d, e, and b1 = 1. The composition can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autonimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions cuch as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to chapsing the exemplification of the present invention
 Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases.

 Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that bind to and activate the human thrombopoletin receptor (TPO-R). Methods of activating thrombopoletin receptors in cells comparate contacting the cells with effective amounts of peptides and peptide mimetics attached to hydrophilic polymers. The methods are used to treat thrombocytopenia such as that due to chemotherapy, radiation therapy or bone-marrow transplantation and to prevent thrombocytopenia in patients at risk. The sequences are used to treat and prevent haematological disorders including thrombocytopenia and platelet disorders. They are used in vitro as unique tools for understanding the biological role of thrombopoietin (TPO) and to develop other compounds that bind to and activate the TPO receptor. The peptides can be used to detect TPO receptors on living ceptor. The peptides can be used to detect TPO receptors on living in purified or natural biological materials. They may also be used for in situation, fluorescence-activated cell sorting, Western blotting and in the tools for in vitro expansion of megakaryocytes and their committed progenitors alone or in conjunction with additional cytokines

This invention relates to novel mammalian CDR mimetibodies, specific fragment where a protein has been inserted into, or replaces a portion of fragment where a protein has been inserted into, or replaces a portion of or one or more CDR regions, such that each CDR mimetibody comprises at least one human framework region and at least one ligand binding region (DRR). The present invention describes human mimetibodies, including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms of immune, cardiovascular, infectious, malignant and/ or neurologic cardiant, antimicrobial, cytostatic and neuroprotective activities. This mimetibody is a proposition of transcence is a manned an anaemia. Accordingly, they exhibit immunomodulator, cardiant, antimicrobial, cytostatic and neuroprotective activities. This mimetibody is a TPO mimetic peptide sequence used to make a

This invention relates to CH1 deleted mimetibodies (and the DNA sequences which encode them), compositions, methods and uses. The invention may be useful for the development of compounds with an immunosuppressive, cardiant. Apportensive, neuroprotective, nootropic, cardiavascular, cardiant. Apportensive, neuroprotective, nootropic, antibacterial, virucide or fungicide activity. In addition, the disclosed sequences may prove useful for gene therapy. The CH1-deleted mimetibody is useful for diagnosing or treating a disease condition in a cell, cissue, organ or animal, specifically for modulating, treating, an immune, cardiovascular (for example arrhythmia, hypertension or heart failure), or neurodegenerative (for example multiple sclerosis, dementia or Alzheimer's disease) diseases (for example bacterial, viral or conditions, or infectious diseases (for example bacterial, viral or fungal infection). The present sequence is that of a peptide which may be used during the creation of a mimetibody of the invention.
 New CH1-deleted mimetibody polypeptides and nucleic acids, useful for modulating, treating, alleviating, preventing an immune, cardiovascular, or neurodegenerative disease or disorder, anemia, cancer, or infectious

[Hyp3]Met-callatostatin. Identification and biological properties of a novel neuropeptide from the blowfly Calliphora vomitoria.";

J. Biol. Chem. 269:21059-21066 (1994).

-I- FUNCTION: May act as a neurotransmitter or neuromodulator and play a role in the integration of information within the brain. May be involved in the control of visceral muscles due to its ability to behave as potent inhibitors of peristalic movements. May also fulfill a neurohornmonal role on muscles of the gut and heart.

-I- TISSUE SPECIFICITY: Neurons within brain and abdominal ganglion.

Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

Claim 8; Page 82; 86pp; Spanish.

of transforming growth (TGF) factor betal (TGF-b1) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides AAY92945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DMA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis The invention relates to synthetic peptides that antagonise the binding

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the Lymphocyte Stimulator (TNF) super family and induces B cell tumour necrosis factor (TNF) super family and induces B cell controlleration and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antibheumatic and antiALDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and activity such as cancer, immune, and autoimmune disorders and immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP41228 represent the antibodies and fragments of the antibodies described in the method of

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to Chromosome 13434 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single cain antibody molecules (scfvs) derived, preferably, from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The from the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As uch, these compositions are useful for identifying immune disorders including myasthenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as AIDS and proliferative disorders including leukaenia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various activities such as antirheumatic, antialtergic and cytostatic. This peptide sequence is a single chain antibody variable heavy CDR3 peptide that immunospecifically binds BLyS of the invention.

This invention describes a novel method for the detection of a mammalian infection by an acid-resistant microorganism (A) by treating a faecal sample with at least two different monoclonal antibodies (MAD) (or their fragments or derivatives) or aptemers (collectively (I)) and detecting formation of a complex (C) between (I) and the corresponding antigen of (A). The first and second (I) bind to epitopes of different antigens (C (Ag). These epitopes are present, after passage through the intestines, in at least some mammals, and have either: (i) their native structure; or infected or immunized with (A), or its extract, lysate, derived protein or fragment, or with a synthetic peptide. Practically all mammals display at least one of the specified epitopes. The method is used to detect infection by acid-fast bacteria, particularly of the genera Helicobacter, Mycobacterium and C ampylobacter, particularly of the genera Helicobacter, Mycobacterium and C supplicically H. Pylori, H. hepaticus, M. tuberculosis, C. jejuni and C. Pylori. (I) may also be used the construction of antigens during passage through the intestines. This sequence represents a fragment of a H. Pylori, beta-urease-binding.

This invention describes a novel method for detecting, in a mammal, infection by an acid-resistant microorganism (A) which comprises reacting a fecal sample with: (I) a receptor (R) such that a complex is formed with an antigen (Ag) of (A), or (i) two different R so that a three-part complex is formed with Ag, and the formation of a complex detected. R are specific for an Ag which, after passage through the intestines, at least in some mammals, retains a native (or corresponding) structure against which the mammal produces antibodies (when immunized or infected with (A), or its extracts, lysates or derived proteins (or fragments) or synthetic peptides). The products of the invention have antibocterial activity. The method is used to diagnose infection by Helicobacter, C ampylobacter or Mycobacterium, particularly H, pylori (most preferred), the hepatica, C. jejuni and M. tuberculosis, and also to monitor the progress of treatment. Receptors, particularly antibodies, directed against Ag can be used therapeutically for treatment of infections. The
 infection. This sequence represents a complementarity determining region (CDR) from an antibody generated against a Helicobacter pylori antigen (catalase or beta-urease) which is used to illustrate the method of the
infection; acid-resistant microorganism; fecal; antibody; diagnosis; antibacterial; complementarity determining region.
 Detecting infections by acid-resistant microorganisms, particularly diagnosing Helicobacter pylori, comprises an immunoassay on a fecal
 method requires only one R to provide a reasonably secure diagnosis (although use of two R improves sensitivity), so is relatively inexpensive and more easily standardized. Also it is direct, nonineasive, suitable for automation and may indicate the stage of an
 ATP-dependant Clp proteinase (clpL) epitopic peptide #SEQ ID 12.

(1). The polypeptide of the investion has at least one biological activity of ATP-dependent Clp proteinase, proline dipeptidase, chorismate mutase homology branched-chain amino acid aminotransferase or serine mutase homology branched-chain amino acid aminotransferase or serine by droxymethyltransferase from Staphylococcus aureus, O-acetylserine sulfhydrolase B from Escherichia coli, preprotein translocase secretion to take methyltransferase from Helicobacter pylori, or 3-dehydroquinate synthase from Streptococcus pneumoniae. Nucleic acids encoding polypeptides of the invention are useful in antisense therapy, as diagnostic agents to detect the presence of the target DNA or RNA sequences to which the specifically bind, and in producing recombinant polypeptides. The polypeptides are useful for producing specific compounds which modulate the action of the polypeptides, and indentifying compounds which modulate the action of the polypeptides, and in the inducing an immunological response. Sequences given in ADH48561-ADH48641 represent polypeptides and polymelectides that are identified in the represent polypeptides and sequences that are identified in the represent polypeptides and polymelectides that are identified in the represent polypeptides and polymelectides that are identified in the represent polymentian as microbial target sequences.

```
This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antitheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and soo may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be associated with aberrant expression of BLyS. They may also be and activity such as cancer, immune, and autoimmune disorders and activity such as cancer, immune, and autoimmune disorders and immunodeficiency (e.g. common variable immunodeficiency (e.g. common variable immunodeficiency (cVID) and acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 13434 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (GcFws) derived, preferably, if refers to single chain antibody molecules (GcFws) derived, preferably, if refers to single heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The present invention refers to the use of such antibodises in various methods for the detection, diagnosis and prognosis of diseases related to the such, these compositions are useful for identifying immune disorders including myasthenia gravis and multiple sclerosis, inflammatory as AIDS and proliferative disorders including leukaemia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various activities such as antirheumatic, antiallergic and cytostatic. This centifiammatory, antiasthmatic, antiallergic and cytostatic. This centifically binds BLyS of the invention.
 Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.

The invention relates to a novel isolated, synthetic or recombinant peptide or polypeptide which includes one or more endothelial cell peptide of the invention has anticumour, cytostatic, vasotropic, antipsoriatic, dermatological, cumour, cytostatic, vasotropic, antiarthritic, dermatological, antidiabetic, antiarthritic, vulnerary, antiulcer, cophthalmological, antidiabetic, antiarthritic, vulnerary, antiulcer, cophthalmological, reducing the proliferation and/or migration of susful for promoting, reducing the proliferation and/or migration of the preferably the peptide, to promote proliferation and/or migration of the treated cells, and for reducing or promoting angiogenesis, by treating the cells with an ECBP antagonist, which is preferably the peptide of the invention is also useful for manufacturing a medicament for promoting angiogenesis, by demarking an enderance or reduce angiogenesis at one or more sites in a treated mammal. The medicament is useful for promoting or reducing angiogenesis. ECBP sequences are useful for promoting or reducing angiogenesis. ECBP sequences are useful to alter the infectivity spectrum of a viral particle. The present sequence represents an ECBP of the

 AAR67114-17 are anti-inflammatory peptides derived from naturally occuring polypeptides that contain proline or proline/cysteine brackets. These peptides are shortened to form fragments that contain one or more interaction sites of interest. AAR67117 is deriv. from fibrinogen gammachain. The dose is 0.8-20 micromoles. The peptide inhibits the interactions between fibrinogen and its leukocyte receptor CD11b/CD18 interactions between fibrinogen and its leukocyte receptor CD11b/CD18 interactions between fibrinogen and its leukocyte that interaction sites possess activity when present in a polypeptide that differs from the native form. Inclusion of conformation-constraining moieties can have desirable effects on an interaction site. (Also see AAR67011-113 and AAR67118-52 for analogues of other biologically active peptides contg interaction site flanked by conformation constraining gps., eg. RGD
 Peptide homologue or analogue with constrained conformation - has proline residues flanking the interaction site to impart greater, or more stable,
